BUILDURL

1.1 buildurl package

1.1.1 buildurl.BuildURL

```
class buildurl.BuildURL(base: str = "", force_trailing_slash: bool = False)
```

Bases: object

Tool to simplify the creation of URLs with query parameters.

Parameters

- **base** – The base URL to build upon.
- **force_trailing_slash** – Whether or not to forcefully include a trailing slash at the end of *path*, *False* by default.

Examples

```
>>> from buildurl import BuildURL
>>> url = BuildURL("https://pypi.org")
>>> print(url.get)
https://pypi.org
>>> url = BuildURL("https://example.com/test",
...     force_trailing_slash=True)
>>> print(url.get)
https://example.com/test/
```

__add__(query: Union[str, Dict[str, Any]]) → buildurl.builder.BuildURL

Generate new URL with added query.

Equivalent to first copying the URL, then using `add_query`.

Parameters **query** – The query key and value to add.

Returns New BuildURL instance.

Examples

```
>>> url = BuildURL("https://example.com")
>>> new_url = url + {"test": "it"}
>>> print(url.get)
https://example.com
>>> print(new_url.get)
https://example.com?test=it
```

__iadd__(query: Union[str, Dict[str, Any]]) → buildurl.builder.BuildURL
Add query arguments inplace.

Essentially a shortcut to add_query.

Parameters **query** – The query key and value to add.

Returns Reference to self.

Examples

```
>>> url = BuildURL("https://example.com")
>>> url += {"key": "value"}
>>> print(url.get)
https://example.com?key=value
>>> url += "another=query&more=stuff"
>>> print(url.get)
https://example.com?key=value&another=query&more=stuff
```

__init__(base: str = "", force_trailing_slash: bool = False)
Initialize a new instance of BuildURL.

__itrudiv__(path: Union[str, List[str]]) → buildurl.builder.BuildURL
Add new path part to the URL inplace.

Essentially a shortcut to add_path.

Parameters **path** – New path to add.

Returns Reference to self.

Examples

```
>>> url = BuildURL("https://example.com")
>>> url /= "test"
>>> print(url.get)
https://example.com/test
>>> url /= ["more", "paths"]
>>> print(url.get)
https://example.com/test/more(paths
>>> url /= "/again/and/again/"
>>> print(url.get)
https://example.com/test/more(paths/again/and/again/
```

__len__() → int
Length of the generated URL.

__repr__() → str
Representation of the current instance.

Returns String representation of self.

Examples

```
>>> url = BuildURL("https://example.com/test?now=true")
>>> print(repr(url))
BuildURL(base='https://example.com/test?now=true', force_trailing_slash=False)
```

__str__() → str
Shortcut for getting the URL.

Can be obtained by printing the instance of the class.

Returns Generated URL.

Examples

```
>>> url = BuildURL("https://example.com")
>>> url /= "test"
>>> print(str(url))
https://example.com/test
>>> print(url)
https://example.com/test
```

__truediv__(path: Union[str, List[str]]) → buildurl.builder.BuildURL
Generate new URL with added path.

Equivalent to first copying the URL, then using add_path.

Parameters **path** – New path to add.

Returns New BuildURL instance.

Examples

```
>>> url = BuildURL("https://example.com")
>>> new_url = url / "testing"
>>> print(url.get)
https://example.com
>>> print(new_url.get)
https://example.com/testing
```

add_path(*args: Union[str, List[str]]) → buildurl.builder.BuildURL
Add to the path.

Parameters ***args** – The paths to add. Can be a string containing a single path, multiple paths separated by /, or a list of single path strings.

Returns Reference to self.

Examples

```
>>> url = BuildURL("https://example.com")
>>> url.add_path("test")
BuildURL(...)
>>> print(url.get)
https://example.com/test
>>> url.add_path(["more", "paths"]).add_path("/again/and/again/")
BuildURL(...)
>>> print(url.get)
https://example.com/test/more(paths/again/and/again/
>>> url = BuildURL("https://example.com")
>>> url.add_path("never", "stopping", "to/play", ["with", "paths"])
BuildURL(...)
>>> print(url.get)
https://example.com/never/stopping/to/play/with/paths
```

`add_query(*args: Union[str, Dict[str, Any]], **kwargs) → buildurl.builder.BuildURL`

Add a query argument.

Parameters

- ***args** – The query keys and values to add. Can be a string containing the keys and values, like “key1=value1&key2=value2”, or a dict, like {“key1”: “value1”, “key2”: “value2”}.
- ****kwargs** – Keyword arguments corresponding to key-value pairs.

Returns Reference to self.

Examples

```
>>> url = BuildURL("https://example.com")
>>> url.add_query({"key": "value"})
BuildURL(...)
>>> print(url.get)
https://example.com?key=value
>>> url.add_query("another=query&more=stuff")
BuildURL(...)
>>> print(url.get)
https://example.com?key=value&another=query&more=stuff
>>> url.add_query(a="b").add_query("c=d", "e=f")
BuildURL(...)
>>> print(url.get)
https://example.com?key=value&another=query&more=stuff&a=b&c=d&e=f
```

`copy() → buildurl.builder.BuildURL`

Create a deep copy of itself.

Examples

```
>>> url = BuildURL("https://example.com")
>>> url_copy = url.copy()
>>> url /= "test"
>>> print(url.get)
https://example.com/test
>>> print(url_copy.get)
https://example.com
```

property get: str

Get the generated URL.

property parts: Tuple[str, ...]

Tuple of necessary parts to construct the URL.

property path: str

Path string.

property query: str

Query string.

set_force_trailing_slash(enabled: bool = True) → buildurl.builder.BuildURL

Set the *force_trailing_slash* attribute.

Parameters **enabled** – The new value for *force_trailing_slash*, default *True*.

Returns Reference to self.

Examples

```
>>> url = BuildURL("https://example.com")
>>> url.set_force_trailing_slash().add_path("test")
BuildURL(base='https://example.com/test/', force_trailing_slash=True)
>>> url.set_force_trailing_slash(False)
BuildURL(base='https://example.com/test', force_trailing_slash=False)
```
